YouTube Upload Setup Guide

LMS Video Generator: connecting your YouTube channel (one-time setup, free, about 10 minutes)

1. Create a project

1. Open https://console.cloud.google.com and sign in. Using the Google account that owns your YouTube channel is simplest.
2. Click the project picker at the top, choose **New project**, name it (for example *LMS Video Uploader*) and click **Create**. Direct link: console.cloud.google.com/projectcreate
3. Make sure the new project is selected in the top bar.

2. Enable the YouTube API

1. Go to **APIs & Services** → **Library** (console.cloud.google.com/apis/library).
2. Search for **YouTube Data API v3**, open it and click **Enable**. Direct link: YouTube Data API v3

3. Set up the consent screen

1. Go to **APIs & Services** → **OAuth consent screen**. It may appear as **Google Auth Platform**; click **Get started**. Direct link: console.cloud.google.com/auth/overview
2. Fill in the fields:
   - **App name:** anything, for example *LMS Video Uploader*.
   - **Support email:** your email.
   - **Audience:** External.
   - **Contact email:** your email.
3. Accept the terms and click **Create**.
4. Open **Audience** → **Test users** → **Add users** (console.cloud.google.com/auth/audience) and add the Gmail address of the account that owns your YouTube channel. Leave the status as **Testing**.

4. Create the OAuth client and download the file

1. Go to **Clients** (console.cloud.google.com/auth/clients), or **Credentials** → **Create credentials** → **OAuth client ID** (console.cloud.google.com/apis/credentials).
2. Set **Application type** to **Web application**.
3. Under **Authorized redirect URIs**, click **Add URI** and paste this exactly:

   ```
   http://127.0.0.1:3000/api/youtube/oauth/callback
   ```

   Use `127.0.0.1`, not `localhost`, with no trailing slash.
4. Click **Create**.
5. In the dialog that appears, click **Download JSON** straight away. Google may not show the secret again later. The file is called something like `client_secret_1234…apps.googleusercontent.com.json`.

5. Add it to the app

1. Open the app at http://127.0.0.1:3000.
2. In the YouTube panel, click **Add client_secret.json** and choose the file you downloaded. The app stores it encrypted in `local/`, so you can then delete the download or keep it somewhere private. Don't share it or commit it to git.
3. Click **Connect YouTube** and sign in. Google will warn **"Google hasn't verified this app"**. That's expected, because it's your own app in testing mode. Click **Continue** and allow access.
4. If your channel is a Brand Account, pick that channel when Google asks.

Things to expect

- **Reconnecting every 7 days:** while the app is in "Testing", Google expires the sign-in after 7 days. Just click **Reconnect** in the panel when it asks.
- **Private uploads:** videos uploaded from an unverified project are kept private by Google. You can make them public yourself in YouTube Studio (https://studio.youtube.com).
- **Daily quota:** the default quota allows about 6 uploads a day (check your quota).

> If the popup shows **"redirect_uri_mismatch"**, the address in step 4 doesn't exactly match the one shown in the panel. Fix it in the client settings (Clients) and try again; the change can take a few minutes to apply.
